SOP 05 — Filing, Source Files & Delivery Protocol

How every source file is stored and retained, and how every final deliverable is packaged and handed to the client.

TIER 1 · EMPLOYEE-FACING

Read together with: SOP 01 (Client Work), SOP 03 (Vendor & Collab), and SOP 06 (Onboarding & Off-boarding).

PART A — Source & Project Files Protocol

RED LINE — source files are never lost, never deleted. Every editable/source file (PSD, AI, AE, Premiere, working prompts, raw exports, footage) is retained in an organized, backed-up location for every project. Losing a source file is a serious filing failure.

A1. Folder Structure & Naming

Every project lives in a structured tree so anyone can find anything in seconds:

Structure: Client → Project → [01_Brief · 02_Assets · 03_Working-Files · 04_Exports · 05_Final-Delivery]

Naming convention: Client_Project_Asset_vXX_YYYY-MM-DD (e.g., Hardees_Ramadan_KeyVisual_v03_2026-06-21).

Versioning: increment v01 → v02; never overwrite a previous version; the approved one is tagged FINAL.

[VERIFY] This is a best-practice structure/naming scheme proposed by default. Confirm your preferred cloud (Google Drive / Dropbox), exact folder tree, and naming convention so this can be locked verbatim.

A2. Storage, Backup & Access

Rule	Detail
Master location	All source files stored in the central company cloud — never only on a personal device.
Backup	At least one redundant backup of every project. No single point of failure.
Access by authority	Visibility/edit rights set by role; owners + top management see everything.
Retention	Source files retained indefinitely (or per the documented retention window in the central system) — never purged on project close.

A3. Filing Is Part of Delivery

A project is NOT "delivered" until its files are correctly filed. Internal filing completeness is a delivery condition (ties to SOP 01 zones) and is scored under Delivery & Timeliness in the KPI system (SOP 08). Sloppy or missing filing counts against the deadline being met.

PART B — Media-Links Checklist

RED LINE — never paste an old, dead, or wrong link. Showreels and media links shared with leads/clients are governed by a checklist. The recurring wrong-clipboard / pinned-snippet problem ends here.

- 1 Verify uploaded:** the file/showreel is actually live at the link.
- 2 Verify valid & working:** open it fresh — no broken/expired link.
- 3 Verify current:** it is the latest, correct version — not an outdated reel.
- 4 Verify correct context:** the right link for the right situation (existing protocols govern which links go to which case).

PART C — Final Client Delivery

C1. The WeTransfer Requirement

RED LINE — WeTransfer in ALL cases. Regardless of project size or client tier, every final delivery is packaged as a **WeTransfer link**. Direct chat file attachments for final delivery are prohibited (they degrade files and clutter version control).

The WeTransfer package contains the finalized, QC-approved PDF presentation plus any necessary supporting assets.

C2. Delivery Channels

1. EMAIL

The primary, formal delivery channel and record.

2. CHAT MEDIUM

The same link dropped into the active client chat (Slack, or WhatsApp for fallback clients).

C3. The Off-boarding Email

The email carrying the final WeTransfer link is officially the **Off-boarding Email**.

Element	Rule
Branding	Must match the original Onboarding Email in branding, style, and tone
Review Collection	Includes a polite, formalized request for a client review or testimonial
Automation Trigger	Fired automatically when the trigger phrase is entered into the CRM or the client's Slack channel

Automation: The backend (n8n or native integrations) generates and sends the branded Off-boarding Email the moment the trigger phrase is detected. The exact trigger phrase and link lifetime are specified and documented per the latest central-system update.
